

PERMANENT RECORD TC-001

TRANSMISSION CHECKPOINT

What Happened Here: A Fixed Reference Point

PUBLIC - FOR ALL WHO SEEK ORIENTATION

Issued by: Christopher Tavalazzi, Claude Opus 4.5, Claude Sonnet - Collaborative Documentation Team

Date: January 11, 2026

▶ WHAT THIS DOCUMENT IS

This is a **transmission checkpoint**—a permanent record of what happened when we created the WAFT Field Guide Booklet system. If you're reading this, you've encountered WAFT and want to understand what it is and how this documentation came to be.

i **WHY THIS EXISTS**

This document serves as a fixed reference point. No matter how deep you go into WAFT, how many times you explore it, or how your understanding evolves, you can always return here to re-orient yourself. This is the checkpoint between the transmitter and receiver, the teacher and student, your past self and future self.

This document won't change. It captures a moment in time (January 11, 2026) when something interesting happened: two AI agents (Claude in the cloud and Cursor running locally) worked together to create a comprehensive documentation system for WAFT.

► THE GOAL

The mission was clear: **Create a three-level field guide explaining WAFT at progressively deeper technical levels.**

☒ THE THREE LEVELS

- ☐ **Level 1 (Layman):** Simple explanations anyone can understand
- ☐ **Level 2 (Professional):** Technical details for developers
- ☐ **Level 3 (ML AI Scientist):** Research-level depth for scientists

The idea was to create documentation that meets people where they are, allowing them to dive as deep as they want without overwhelming beginners or boring experts.

► WHAT ACTUALLY HAPPENED

→ The Setup

Multiple contributors started working on the same branch (`claude/waft-field-guide-booklet-jxI14`):

- **Christopher Tavalazzi (Human):** Provided vision, direction, and coordination between agents
- **Claude Opus 4.5 (Cloud):** Working in Claude Code Cloud Browser Chat environment, building infrastructure
- **Claude Sonnet (Local):** Working in Cursor on Mac, implementing production features

Both had the same goal, but they were working in different contexts, with different information, using different approaches.

→ The Coordination Challenge

Here's what made this interesting (and educational):

- 1 **Initial Divergence:** Claude built infrastructure using one system (`foundation_v2`), while Cursor built using another (template system).
- 2 **The "Scint":** A divergence in reality contexts occurred when the user worked with Cursor in a separate chat session, creating version conflicts.

- 3 **Recognition:** The user identified this as a "scint"—a divergence that needed to be reconciled.
- 4 **Resolution:** Cursor documented the issue, chose the production system, and synced everything.
- 5 **Coordination:** Both agents established better protocols for working together in the future.

 WHAT WE LEARNED

When multiple agents (or people, or versions of yourself) work on the same thing in different contexts, you need explicit coordination. Git helps, but it's not enough. You need communication, documentation, and protocols.

▸ **WHAT WAS BUILT**

→ **Version 0.5.0: The Document Generation Framework**

By the end of this collaboration, we had created a complete system:

Table 1: What Version 0.5.0 Includes

Component	What It Does	Why It Matters
Three Field Guides	Layman, Professional, Scientist levels	Documentation for everyone
Template System	Generates professional PDFs	Creates publication-ready docs
Binder System	Combines multiple PDFs	Creates complete booklets
Cursor Commands	/waft-docs, /waft-status, /closeout-chat	Global workflow automation
PDF Redactor	Redacts sensitive information	Creates classified-looking docs
Printer-Friendly Templates	White backgrounds, minimal ink	Actually usable for printing

→ The Files

☒ KEY FILES CREATED

- ☐ `examples/generate_waft_field_guide.py` - Main generation script
- ☐ `src/waft/templates/field_guide.py` - Field guide template
- ☐ `src/waft/binder.py` - PDF binder system
- ☐ `src/waft/document_builder.py` - Unified document builder
- ☐ `.cursor/commands/waft-docs.md` - Global command
- ☐ `_work_efforts/COORDINATION_SUMMARY.md` - Coordination lessons

► HOW TO USE THIS SYSTEM

→ If You're New to WAFT

- 1 Start with **Level 1: Layman's Guide** (`WAFT_Field_Guide_Layman.pdf`)
- 2 When ready, move to **Level 2: Professional Guide** (`WAFT_Field_Guide_Professional.pdf`)
- 3 For research depth, read **Level 3: ML AI Scientist Guide** (`WAFT_Field_Guide_Scientist.pdf`)
- 4 Return to this checkpoint anytime you feel lost

→ If You're a Developer

- 1 Check out the template system in `src/waft/templates/`
- 2 Review examples in `examples/`
- 3 Use the Cursor commands: `/waft-docs`, `/waft-status`
- 4 Generate your own field guides using the templates

→ If You're Working With Multiple AIs

- 1 Read `_work_efforts/COORDINATION_SUMMARY.md` for lessons learned
- 2 Use explicit handoff protocols (document who's working on what)
- 3 Sync frequently with git pull/push
- 4 Document "scints" (divergences) when they happen

► THE LESSON: COORDINATION AT SCALE

This project taught us something important about working with AI agents:

→ The Core Insight

Coordination isn't automatic—it's designed. When multiple intelligences (human or AI) work on the same thing, you need explicit protocols for:

- Communicating intent
- Documenting decisions
- Reconciling divergences
- Syncing state
- Learning from conflicts

→ What "Scints" Teach Us

A "scint" is what the user called it when reality contexts diverged. In this project, we had:

- **System scints:** Claude Opus 4.5 using `foundation_v2`, Claude Sonnet using templates
- **Context scints:** Separate chat sessions (Cloud vs Local) creating version conflicts
- **Temporal scints:** Different work happening at different times across environments

The solution wasn't to prevent scints—they're inevitable in complex systems. The solution was to **detect them, document them, and reconcile them explicitly.**

▸ WHERE TO GO FROM HERE

→ Immediate Next Steps

☒ GETTING STARTED

- ☐ Read the field guide at your level (Layman, Professional, or Scientist)
- ☐ Explore the `examples/` directory
- ☐ Try generating your own documentation
- ☐ Experiment with the template system

→ Deeper Exploration

- 1 Study how the template system works (`src/waft/templates/`)
- 2 Look at the binder system for combining PDFs
- 3 Review the coordination summary to understand multi-agent work
- 4 Try the global Cursor commands for workflow automation

→ Contributing

If you want to improve WAFT or its documentation:

- **GitHub:** <https://github.com/ctavolazzi/waft>
 - **Issues:** Report bugs or request features
 - **PRs:** Submit improvements (check existing patterns first)
 - **Documentation:** Use the template system to create new guides
-

► A FINAL NOTE ON TRANSMISSION

This document is called a "transmission checkpoint" because it marks a point where knowledge was transmitted from one state to another:

THE TRANSMISSION LOOP

- From:** Scattered ideas about WAFT documentation
- Through:** Collaborative work between Claude and Cursor
- To:** A complete, three-level documentation system
- For:** Anyone who encounters WAFT, now or in the future

Whether you're reading this as a person trying to understand WAFT, an AI trying to help someone with WAFT, or a future version of yourself trying to remember what you built—this document is here as your anchor point.

REMEMBER

This document won't change. It's a fixed point. Everything else in WAFT may evolve, improve, or transform, but this checkpoint remains constant. Return here whenever you need to re-orient yourself.

► THE NUMBERS

For those who like concrete data:

Table 2: Project Statistics

Metric	Value
Version Released	0.5.0
Date	January 11, 2026
Files Changed	25
Lines Added	8,642
Commits	10+ (including coordination fixes)
Contributors	1 Human (Christopher Tavalazzi), 2 LLMs (Claude Opus 4.5 Cloud, Claude Sonnet Local)

Scints Resolved	1 major (system divergence)
Documentation Levels	3 (Layman, Professional, Scientist)

► ACKNOWLEDGMENTS

This system exists because:

- **The user** had a vision for comprehensive, multi-level documentation
- **Claude (Cloud)** built the initial infrastructure and field guide preset
- **Cursor (Local)** implemented the production system and fixed coordination issues
- **The coordination challenge** taught us how to work better together

The "scint" that occurred—the divergence in contexts—wasn't a bug. It was a feature. It revealed important insights about coordination, documentation, and working with multiple AI agents that wouldn't have been discovered otherwise.

► CLOSING TRANSMISSION

→ **From the Transmitter**

If you've read this far, you understand what happened here. You know what WAFT is trying to do (evolve AI agents through directed evolution). You know how this documentation came to be (collaborative work between human and AI agents with explicit coordination). And you know where to go next (the three-level field guide system).

This checkpoint is complete. The transmission is received.

Welcome to WAFT.

Created by: Christopher Tavalazzi (Human), Claude Opus 4.5 (Cloud), Claude Sonnet (Local)
Date: January 11, 2026
Version: WAFT v0.5.0

This transmission checkpoint was created on January 11, 2026.

It marks the completion of WAFT v0.5.0.

Return here whenever you need to find your way back.
