

WAFT QUICKSTART

Get Started in 5 Minutes

✓ Prerequisites

- Python 3.11+
- uv package manager (recommended) or pip
- OpenAI API key (or compatible LLM)

Step 1: Install WAFT

```
1 uv tool install waft
```

Shell

Or with pip:

```
1 pip install waft
```

Shell

Verify installation:

```
1 waft --version
```

Shell

Step 2: Create a Laboratory

```
1 waft new my_first_lab
2 cd my_first_lab
```

Shell

This creates:

```
1 my_first_lab/
2 └─ waft.toml      # Configuration
3 └─ agents/        # Your agent code
4 └─ checkpoints/   # Evolution snapshots
5 └─ flight_data/    # Telemetry database
```

Step 3: Verify Setup

```
1 waft verify
```

Shell

Expected output:

```
1 ✓ Configuration valid
2 ✓ Storage initialized
3 ✓ Agent framework ready
```

4 ✓ Scint Gym operational

5 Ready for evolution!

Step 4: Create Your First Agent

Create `agents/my_agent.py`:

```
1 from waft import Agent
2
3 class MyAgent(Agent):
4     """A simple agent to evolve."""
5
6     system_prompt = """You are a helpful
7     assistant. Be concise and accurate."""
8
9     def process(self, input: str) -> str:
10         return self.llm.generate(
11             self.system_prompt,
12             input
13         )
```

Python

Step 5: Run Evolution

```
1 waft evolve --agent MyAgent --generations 5
```

Shell

Watch as WAFT:

1. Spawns initial population
2. Evaluates in Scint Gym
3. Selects fittest agents
4. Breeds and mutates
5. Repeats for 5 generations

Step 6: Check Results

```
1 waft flight list      # View events
2 waft agents info MyAgent # Agent details
3 waft dashboard        # Launch UI
```

Shell

Congratulations!

You've run your first evolution cycle.
Your agents are now breeding and improving.

Next Steps:

- Read the Evolution Cookbook
- Explore the Scint Gym Guide
- Check out example agents

“Don't just build agents. Breed them.”
