

TROUBLESHOOTING

WAFT | Common Issues and Solutions

Installation Issues

“Command not found: waft”

Problem: WAFT not in PATH after installation.

Solutions:

1. If using uv: Run `uv tool install waft` again
2. If using pip: Ensure `~/.local/bin` is in PATH
3. Try: `python -m waft` instead

“Module not found” errors

Problem: Dependencies not installed correctly.

Solutions:

1. Run `uv sync` or `pip install -e .` in WAFT directory
2. Check Python version (3.11+ required)
3. Try fresh virtual environment

Runtime Issues

“API key not found”

Problem: LLM API key not configured.

Solutions:

1. Set `OPENAI_API_KEY` environment variable
2. Or configure in `waft.toml`:

```
[llm]
api_key = "sk-..."
```

Evolution stalls at 0% fitness

Problem: All agents failing Scint Gym.

Solutions:

1. Check agent code for syntax errors
2. Verify LLM connectivity
3. Lower difficulty settings in config
4. Check logs: `waft flight list --type GYM_EVAL`

“Timeout” errors during evaluation

Problem: Gym scenarios taking too long.

Solutions:

1. Increase timeout in config:

```
[gym]  
timeout_seconds = 600
```

2. Use faster LLM model
3. Simplify agent logic

Performance Issues

Evolution too slow

Causes and solutions:

- Large population → Reduce to 10-20
- Complex scenarios → Use simpler gym config
- Slow LLM → Use faster model or local
- Serial execution → Enable parallel:

```
[gym]  
parallel_workers = 4
```

High memory usage

Causes and solutions:

- Large population history → Prune old generations
- Flight Recorder growth → Archive old data
- Agent memory leaks → Check custom agent code

Getting Help

1. Check logs: `waft flight list`
2. Run diagnostics: `waft verify --verbose`
3. Search issues: github.com/ctavolazzi/waft/issues
4. Open new issue with:
 - WAFT version (`waft --version`)
 - Error message
 - Steps to reproduce
