

BEING LIFECYCLE

WAFt | From Spawn to Death

The Lifecycle

SPAWN → DEVELOP → EVOLVE → MATURE → (DEATH or TRANSCEND)

Phase 1: Spawn

A Being comes into existence with initial attributes.

```
being = system.spawn_being(  
    reality_id="my_reality",  
    initial_skills={  
        "reasoning": 5.0,  
        "creativity": 4.0,  
    },  
)
```

At Spawn:

- Unique being_id assigned (UUID v4)
- Skills initialized
- Empty memory
- No personality (neutral)
- No goals

Phase 2: Develop

The Being acquires memories, personality, and goals.

```
# Set personality  
being.personality = {  
    "curious": 0.8,  
    "cautious": 0.6,  
    "ambitious": 0.9,  
}  
  
# Set goals  
being.goals = [  
    {"goal": "Learn quantum physics", "priority": 1.0},  
    {"goal": "Build research team", "priority": 0.8},  
]  
  
# Record first memory  
being.record_memory()
```

```
    "I was created to explore the unknown.",  
    memory_type="origin",  
)
```

Phase 3: Evolve

Through experience, the Being's attributes change.

Skill Development

```
# Skills improve through use
being.skills["reasoning"] += 0.5 # Practice makes better

# New skills can be acquired
being.skills["leadership"] = 3.0 # New responsibility
```

Memory Accumulation

```
being.record_memory(
    "Completed first successful experiment",
    memory_type="achievement",
    metadata={"impact": "high", "date": "2026-03-15"},
)
```

Personality Shifts

```
# Experience shapes personality
being.personality["cautious"] -= 0.1 # Became bolder
being.personality["confident"] = 0.7 # New trait emerged
```

Phase 4: Mature

A mature Being has:

Rich History

- Many memories
- Diverse experiences
- Learned lessons

Defined Character

- Stable personality
- Clear goals
- Strong skills

Phase 5: End States

Death

```
# Low fitness leads to death
if being.fitness < 0.3:
    system.terminate_being(being.being_id)
    # Logged in Flight Recorder as DEATH event
```

Transcendence (Theoretical)

If a Being evolves beyond normal parameters, it may achieve **emergence** — becoming something more than its original design.

Emergence Indicators:

- Self-modeling capability
- Goal generation
- Meta-learning
- Novel problem-solving

Lifecycle Queries

```
# View Being history
waft being history <being_id>
```

```
# Check Being status
waft being status <being_id>

# List all Beings in reality
waft beings list --reality my_reality
```
