What Happened

This document summarizes a comprehensive self-testing session where WAFt's own tools were used to test and validate WAFt itself. The session demonstrated a complete "eating our own dog food" approach, resulting in significant quality improvements and successful batch verification with karmic wager confirmation.

The testing covered: Project structure verification LaTeX generator functionality Scientific self-examination capabilities Test framework operation Batch verification with karmic wagers.

A comprehensive test suite was created using: waft verify for project structure validation Custom test scripts for LaTeX generator functionality ScientificPDFGenerator for self-examination and quality analysis Pytest framework for standard test validation WAFt's PDFGenerator for test summary documentation.

The approach followed an iterative cycle: Initial testing to establish baseline Quality analysis to identify gaps Targeted improvements based on findings Re-testing to verify improvements Batch verification with karmic wager.

Project Verification: PASSED (100% integrity) LaTeX Generator: ALL TESTS PASSED (5/5) Self-Examination: PASSED (Quality: 0.62, Structure: 0.25) Pytest Framework: PASSED.

Additional Details

Document Structure Enhancement: Added Introduction, Methodology, and Results sections. Result: Structure score improved from 0.25 to 1.0 (300% improvement).

Study Gym Integration Fix: Corrected session initialization to use proper challenge configuration. Result: Hypothesis testing now works correctly, hypothesis confirmed.

LaTeX Generator Fix: Fixed fallback code to use summary and ideas instead of non-existent raw_content attribute. Result: All LaTeX tests pass.

Placing karma on hypotheses creates accountability and engagement through risk/reward mechanics, motivating thorough verification.

Test scripts created: testlatexgenerator.py, testselfexamination.py, generatetestsummary.py, testbatchwithwager.py, generateimprovements_summary.py.
