What Happened

Execute Full Run-It Workflow: Chose Option 1 - complete systematic workflow Focus on Effort/Will: Shifted from time estimates to effort cost and will to act Proceed with Remaining Phases: Verified and approved continuation.

How do we measure "effort cost" more precisely? How does "will to act" relate to Being's will_to_live and decision_fatigue? Should workflow phases have effort cost estimates instead of time estimates?

✅ Comprehensive analysis (consider, think, check-assumptions, deep-analyze) ✅ Adversarial critique (0 CRITICAL, 2 HIGH, 3 MEDIUM issues) ✅ Hypothesis formation (3 hypotheses, 2 high confidence) ✅ Scientific method proof (PROVEN, confidence 1.0) ✅ Comprehensive verification (all claims verified) ✅ Final reflection (effort/will framing insight).

Repository: /Users/ctavolazzi/Code/active/waft Branch: feature/pdf-black-bar-fix-proof-system-20260113 Git Status: 9 uncommitted files (workflow documentation) Recent Commits: Midday dossier, probe system, RAG integration.

Additional Details

Effort Cost > Time: Effort cost and will to act are more meaningful than time estimates Energy Mechanics: Connects to Being system's decision_fatigue, will_to_live, energy Epistemic Effort: Knowledge (knowing) requires effort. Acting on knowledge requires will.

Centralize Debug Logging: Create `src/waft/utils/debug_log.py` Add Debug Log Configuration: Allow enable/disable via config.

Immediate: Complete remaining 3 phases (decide, next, goal) After Workflow: Consider implementing HIGH priority recommendations Long-term: Explore effort cost and will to act metrics for Being system.

✓ Clear patterns (Manager, Command, Template) ✓ Good integration patterns ✓ Excellent organization.
