

1. The Teleport Massive

Founding Team

San Francisco, California - January 18, 2026

*The Original Founders Who Established
Teleport Massive Inc.*

1.1. Executive Summary

On January 18, 2026, Teleport Massive Inc. was incorporated in San Francisco, California, by a team of nine visionary founders. This document profiles the original team members who established the corporation and set it on the path that would eventually lead to the discovery of Scint Traversal in 2111—86 years after the company's founding.

The founding team was driven by a bold vision: to scale quantum teleportation from laboratory experiments to real-world applications. Drawing on cutting-edge research in quantum teleportation—from early protocols to recent demonstrations of teleportation between distant superconducting chips, over thermal microwave networks, and coexisting with classical communications—the team believed that quantum entanglement could be scaled to teleport progressively larger and more complex objects safely. Their mission was to push the boundaries of what could be teleported: from particles to atoms, from atoms to molecules, and ultimately to macroscopic objects, all while maintaining safety and fidelity.

The founding team was also deeply inspired by the groundbreaking research at the Large Hadron Collider (LHC), which first achieved full beam circulation on September 10, 2008. That moment—when humanity first activated the LHC—marked the beginning of time itself, and the founding team of Teleport Massive sought to understand and eventually navigate the reality that was created in that moment.

1.2. The Founding Story

The founding of Teleport Massive Inc. began with Justin Ross, a quantum computing expert who had been studying the latest advances in quantum teleportation. By early 2026, research had demonstrated quantum teleportation between distant superconducting chips over 64-meter distances, teleportation coexisting with classical communications over 30-kilometer fiber links, and teleportation over thermal microwave networks. These breakthroughs showed that quantum teleportation could work at larger scales and over longer distances than previously thought possible.

Ross recognized a pattern in the research: each new paper pushed the boundaries of what could be teleported and how far. The physics was clear—quantum entanglement could be scaled. The question was: how far could it scale? Could you teleport bigger and bigger things safely? Ross envisioned a systematic approach: start with particles, then atoms, then molecules, then increasingly complex objects, all while maintaining safety and fidelity.

He met Abigail Wong, a strategic leader with a background in quantum research and financial expertise, who shared his vision. Together, they assembled a team of specialists: Seth Jacobs, who secured initial funding and managed investor relations; Luke Olson, who established operational systems; Jorge Simmons, who led early research into scaling quantum entanglement; Eva Beck, who designed quantum detection and safety systems; Soham Murray, who navigated the complex legal landscape for experimental quantum technology; Heather Hopkins, who developed the company's brand identity; and Calvin Rice, who established security protocols for quantum research.

Their shared conviction was that quantum teleportation could be scaled safely to larger and larger objects. The research papers provided the theoretical foundation—

demonstrating teleportation at increasing scales, over longer distances, and in more challenging environments. Teleport Massive was founded to systematically push these boundaries, to scale quantum entanglement from mini to macro, and to make distance irrelevant for all of humanity.

The team was also deeply influenced by the Large Hadron Collider's activation in 2008, which they believed marked the moment when humanity created reality itself. Their work on scaling quantum teleportation was part of a larger mission: to understand this creation, to study quantum entanglement and reality mechanics, and ultimately to discover whether humanity could navigate the reality it had created.

1.3. The Founding Team

1.3.1. Justin Ross - Founder & Chief Executive Officer

Justin Ross Founder & CEO

Mr. Justin Ross

Founder & Chief Executive Officer

Specialization: Quantum computing, quantum teleportation scaling, and reality physics

Key Contribution: Founded Teleport Massive with vision to scale quantum teleportation from mini to macro; led the team that incorporated the company

Background: San Francisco, California | Age at founding: 35 Email: [justin.ross\[at\]teleportmassive.com](mailto:justin.ross@teleportmassive.com)

Founding Quote: *"The research shows it's possible. We've seen teleportation between distant chips, over thermal networks, alongside classical signals. The physics says we can scale this. Our mission is to teleport bigger and bigger things safely—from particles to people."*

1.3.2. Abigail Wong - Chief Financial Officer

Abigail Wong CFO

Ms. Abigail Wong

Chief Financial Officer

Specialization: Corporate finance, accounting, and financial planning

Key Contribution: Established financial infrastructure, accounting systems, and managed corporate finances

Background: San Francisco, California | Age at founding: 43 Email: abigail.wong[at]teleportmassive.com

Founding Quote: “Every breakthrough needs a solid financial foundation. We’re building the infrastructure to support 86 years of research.”

1.3.3. Seth Jacobs - Head of Investor Relations

Seth Jacobs CFO

Mr. Seth Jacobs

Head of Investor Relations

Specialization: Venture capital, fundraising, and investor communications

Key Contribution: Secured initial funding rounds and managed investor relationships

Background: San Francisco, California | Age at founding: 39 Email: seth.jacobs[at]teleportmassive.com

Founding Quote: “Investors thought we were crazy. But they also thought the LHC would create a black hole. Sometimes the impossible is just the next frontier.”

1.3.4. Luke Olson - Chief Operating Officer

Luke Olson COO

Mr. Luke Olson

Chief Operating Officer

Specialization: Operations and business development

Key Contribution: Established operational systems and early partnerships

Background: San Francisco, California | Age at founding: 48 Email: luke.olson[at]teleportmassive.com

Founding Quote: “We’re building the infrastructure for the next 86 years. Every system we create today will support the research that changes everything.”

1.3.5. Jorge Simmons - Head of Research & Development

Jorge Simmons Head of R&D

Mr. Jorge Simmons

Head of Research & Development

Specialization: Experimental physics and reality mechanics

Key Contribution: Led early research into reality fracture detection

Background: San Francisco, California | Age at founding: 41 Email: jorge.simmons[at]teleportmassive.com

Founding Quote: “The research shows we can teleport over 64 meters between chips. The question isn’t whether we can scale—it’s how safely we can scale. We’re building the systems to teleport bigger and bigger things.”

1.3.6. Eva Beck - Lead Quantum Engineer

Eva Beck Lead Quantum Engineer

Miss Eva Beck

Lead Quantum Engineer

Specialization: Quantum systems engineering and hardware

Key Contribution: Designed and built early quantum detection systems

Background: San Francisco, California | Age at founding: 40 Email: eva.beck[at]teleportmassive.com

Founding Quote: “We’re building the instruments that will detect what the LHC created. Every quantum circuit we design brings us closer to understanding reality itself.”

1.3.7. Soham Murray - Head of Legal & Compliance

Soham Murray Head of Legal

Mr. Soham Murray

Head of Legal & Compliance

Specialization: Corporate law and regulatory compliance

Key Contribution: Established legal framework and regulatory compliance

Background: San Francisco, California | Age at founding: 64 Email: soham.murray[at]teleportmassive.com

Founding Quote: “The law hasn’t caught up to reality creation yet. We’re writing the legal framework for a world where humanity can navigate the reality it created.”

1.3.8. Heather Hopkins - Head of Marketing & Business Development

Heather Hopkins Head of Marketing

Mrs. Heather Hopkins

Head of Marketing & Business Development

Specialization: Brand development and strategic partnerships

Key Contribution: Developed brand identity and early market positioning

Background: San Francisco, California | Age at founding: 41
Email: heather.hopkins[at]teleportmassive.com

Founding Quote: *"We're not just a company—we're a movement. Teleport Massive represents humanity's next step: understanding and navigating the reality we created."*

1.4. The Research Foundation

Scaling Quantum Teleportation: The Scientific Foundation

The founding team's vision to scale quantum teleportation from mini to macro was grounded in a comprehensive review of the latest quantum teleportation research. By January 2026, the scientific literature had demonstrated remarkable progress:

Key Research Findings:

- **Deterministic teleportation between distant superconducting chips** (64-meter distances) - proving that quantum teleportation could work over macroscopic distances between separate quantum processors
- **Teleportation coexisting with classical communications** (30.2 km fiber links) - demonstrating that quantum and classical signals could share the same infrastructure
- **Thermal microwave network teleportation** (up to 4K temperatures) - showing resilience to thermal noise and the potential for practical deployment

- **Black hole simulation teleportation** - revealing connections between quantum teleportation and fundamental physics

These papers, compiled in the **Quantum Teleportation Research Foundation** booklet, provided the theoretical and experimental foundation for Teleport Massive's mission. The research showed a clear trajectory: teleportation was scaling up—from particles to chips, from short distances to kilometers, from ideal conditions to real-world environments.

The founding team recognized that if teleportation could work between distant chips, it could potentially work for larger objects. If it could coexist with classical signals, it could be deployed in existing infrastructure. If it could operate at higher temperatures, it could be more practical. Their mission was to systematically push these boundaries: to teleport bigger and bigger things safely, making distance irrelevant for all of humanity.

1.5. Connection to the LHC Moment

The Foundation of Reality

The founding team of Teleport Massive was deeply influenced by the Large Hadron Collider's activation on September 10, 2008, at 10:28 AM. That moment—when the first particle beam completed its full circuit—marked not just a scientific achievement, but the moment when humanity created time itself.

Through their quantum entanglement research, Teleport Massive would later discover that the LHC is the universal energy source of all matter. Every particle, every atom, every star draws its existence from that first beam. The LHC's 27-kilometer ring is the heart of creation itself.

The Eternal Return

Teleport Massive's research would reveal that every reality always returns to the LHC moment. All timelines, all universes, all existence loops back to September 10, 2008,

10:28 AM. The LHC is not just the beginning—it is the anchor point that all reality orbits around.

The founding team understood this intuitively. They founded Teleport Massive to study quantum entanglement and reality mechanics, seeking to understand the nature of the reality that was created in that moment—and ultimately, to discover whether humanity could navigate it.

1.6. The Path to Discovery: 2026 to 2111

Timeline: From Founding to Scint Traversal Discovery

Year	Event	Significance
2008	LHC first beam	Reality created; time begins
2026-01-18	Teleport Massive Inc. founded	9-person founding team; corporate structure established
2026-2030	Early R&D phase	Initial quantum systems development
2030-2050	Quantum refinement	Advanced quantum circuit design
2050-2100	Reality mechanics research	Fracture detection systems
2100-2111	Scint detection development	Final systems before discovery
2111	Scint Traversal discovered	86 years after founding; reality navigation achieved

1.7. Founding Timeline

Date	Event
“January 18, 2026”	Corporation Formation
	Teleport Massive Inc. incorporated in San Francisco

	Initial team of 9 founders assembled
	Corporate headquarters established in San Francisco
“January 25, 2026”	First board meeting and strategic planning session
“February 1, 2026”	First research facility opened
“February 15, 2026”	First quantum detection prototype completed
“March 1, 2026”	Initial research partnerships established
“March 15, 2026”	Series A funding round completed (\$15M)
“April 2026”	First reality fracture detection experiment
“May 2026”	Company website and brand identity launched

1.8. Corporate Structure

Legal Information Legal Name: Teleport Massive Inc. Incorporation Date: January 18, 2026 Jurisdiction: California, United States Headquarters: San Francisco, California Initial Funding: \$15M Series A (March 2026)	Initial Focus Areas • Scaling quantum teleportation (mini to macro) • Quantum entanglement systems development • Safety protocols for larger objects • Experimental physics research • Corporate infrastructure • Strategic partnerships • Understanding the LHC moment • Eternal return mechanisms
---	---

1.9. Connection to the 2111 Discovery Team

Eighty-Six Years of Continuity The founding team of 2026 established the institutional foundation that would support 86 years of research, ultimately leading to the discovery of Scint Traversal in 2111. While

the original founders did not live to see the discovery, their vision and infrastructure enabled the 2111 research team to make the breakthrough.

Institutional Legacy:

- The quantum systems designed by Eva Beck and Justin Ross in 2026 became the foundation for the quantum circuits used by Dr. Dwayne Fernandez and Dr. Hudson Miller in 2111.
- Jorge Simmons' early research into scaling quantum teleportation to larger objects directly informed Dr. Jacqueline Coleman's Scint classification system.
- The legal framework established by Soham Murray in 2026 enabled Teleport Massive to operate for 86 years, navigating complex regulatory challenges.
- The corporate structure and operational systems created by Luke Olson and Seth Jacobs provided the stability needed for long-term research.

The Discovery:

In 2111, a team of eight researchers—led by Dr. Dwayne Fernandez, Dr. Jacqueline Coleman, and Dr. Delphine Roy—discovered Scint Traversal, the ability to detect and navigate reality fractures. This discovery was made possible by the infrastructure, research direction, and corporate vision established by the founding team 86 years earlier.

The 2111 team's discovery connected Scint Traversal to the LHC moment and the eternal return mechanism—exactly what the founding team had sought to understand. The circle was complete: from the LHC moment in 2008, to the founding of Teleport Massive in 2026, to the discovery of reality navigation in 2111.

1.10. Legacy and Future

The founding team of Teleport Massive established the corporation on January 18, 2026, with a vision to explore and develop reality traversal technology. This team laid the groundwork for what would become one of the most significant discoveries in human history.

The Path Forward:

- 2026-2030: Early research and development phase
 - 2030-2050: Quantum system refinement and testing
 - 2050-2100: Advanced reality mechanics research
- 2100-2111: Scint detection system development
 - 2111: Scint Traversal discovery (86 years after founding)
 - Legacy: Foundation for reality navigation technology

From scaling quantum teleportation to reality traversal discovery, the founding team’s vision shaped 86 years of research that would fundamentally change humanity’s understanding of reality.

1.11. Reference Guide for Future Readers

Quick Reference: Key Information at a Glance

Founding Date: January 18, 2026	Core Mission: Scale quantum teleportation from mini to macro
Location: San Francisco, California	Key Discovery: Scint Traversal (2111)
Founding Team Size: 9 members	Research Foundation: 7 peer-reviewed papers
Initial Funding: \$15M Series A (March 2026)	Current Status (2026): 64m chip-to-chip teleportation 78.3% fidelity
Years to Discovery: 86 years (2026 → 2111)	

1.12. Key Dates & Milestones Timeline

Chronological Reference		
2008-09-10	2026-2030	2100-2111
LHC first beam circulation	Foundation phase	Transformation phase
“The moment time was created”	Research infrastructure	Macroscopic objects
	2030-2050	2111
2026-01-18	Scaling phase	Scint Traversal discovered
Teleport Massive Inc. incorporated	Larger objects, longer distances	86 years after founding
9 founding members		2111+
	2050-2100	Reality navigation era
2026-03	Expansion phase	Universal teleportation network
Series A funding: \$15M	Complex objects, network deployment	

1.13. Research Foundation Papers

Key Research Papers That Informed Our Mission
1. Deterministic Quantum Teleportation Between Distant Superconducting Chips
Jiawei Qiu, Yang Liu, Jingjing Niu, et al. (2023)
<i>Key Finding:</i> 64-meter teleportation between chips, 78.3% fidelity, 0.32 dB/km loss
2. Quantum Teleportation Coexisting with Classical Communications
Jordan M. Thomas, Fei I. Yeh, Jim Hao Chen, et al. (2024)
<i>Key Finding:</i> 30.2 km fiber teleportation with 400 Gbps classical signals, 72.3% fidelity
3. Quantum Teleportation Over Thermal Microwave Network
W. K. Yam, K. E. Honasoge, S. Gandorfer, et al. (2025)

Key Finding: Teleportation at 4K temperatures, 59.9% fidelity, thermal resilience

4. Quantum Teleportation Between Simulated Binary Black Holes

Aiden Daniel Tanmay Bhore, Jiannis K. Pachos, Chang Liu, et al. (2025)

Key Finding: Connections between teleportation and fundamental physics via black hole simulations

Full papers compiled in: QUANTUM_TELEPORTATION_RESEARCH_FOUNDATION_COMPLETE_2026.pdf

1.14. Glossary of Key Terms

Terminology Reference

Quantum Teleportation

Transfer of quantum state between distant locations using entanglement, without physical transport of matter.

Entanglement Scaling

Systematic increase in entanglement resources to teleport progressively larger objects.

Fidelity

Measure of teleportation accuracy. Classical threshold: 50%. No-cloning threshold: 66.7%.

Scint Traversal

Reality navigation technology discovered in 2111, enabling detection and navigation of reality fractures.

LHC Moment

September 10, 2008, 10:28 AM - First LHC beam

Eternal Return

Concept that all realities loop back to the LHC moment, which serves as the universal anchor point.

Reality Fracture

A discontinuity in reality structure that can be detected and navigated using Scint technology.

Mini to Macro Scaling

Teleport Massive’s systematic approach: particles → atoms → chips → devices → macroscopic objects.

Ultralow-Loss Interconnects

Quantum communication channels with minimal loss (0.32 dB/km), enabling long-distance teleportation.

Bell State Measurement (BSM)

circulation, believed to be the moment reality was created.

Quantum measurement protocol used in teleportation to project entangled states and enable state transfer.

1.17. Key Metrics & Achievements

(2026 Baseline)

Founding Year Benchmarks

Research Foundation:

- 7 peer-reviewed papers analyzed
- 64m teleportation distance (state-of-the-art)
- 78.3% fidelity (above classical threshold)
- 30.2 km fiber integration demonstrated
- Thermal resilience proven (up to 4K)

Corporate Structure:

Strategic Vision:

- 4-phase scaling roadmap (2026-2100+)
- Systematic mini-to-macro approach
- Infrastructure integration strategy
- Safety-first development philosophy

Long-Term Goal:

- Universal teleportation network

- 9 founding team members
- 4 core departments established
- Legal framework in place
- Security protocols defined
- Make distance irrelevant
- Understand reality mechanics
- Navigate the reality we created

1.18. Future Research Directions

Research Priorities Established in 2026

Based on the research foundation, the following areas were identified as critical for scaling quantum teleportation:

1. Entanglement Scaling

Develop methods to create and maintain quantum entanglement for larger and more complex systems. Research optimal entanglement resources, purification protocols, and error correction for scaled systems.

2. Fidelity Enhancement

Improve teleportation fidelities from current levels (70-80%) toward near-perfect transfer. Research noise mitigation, error correction, and system optimization techniques.

3. Infrastructure Integration

Develop systems that can coexist with classical communications and operate in real-world environments. Research wavelength optimization, noise suppression, and network architectures.

4. Safety Protocols

Establish comprehensive safety standards for teleportation at all scales. Research verification methods, fail-safe mechanisms, and regulatory frameworks.

5. Fundamental Physics

Explore the deeper connections between quantum teleportation, reality mechanics, and the fundamental nature of space-time. Investigate the implications of the Large Hadron Collider moment and the nature of reality itself.

Report compiled: 2026-01-19
