What Happened

Personality Types analytical: High willpower, prefers learning and goal pursuit systematic: Very high willpower, structured approach creative: Lower willpower, prefers exploration intuitive: Lower willpower, flexible approach balanced: Base willpower, balanced preferences.

src/waft/being.py - Extended with lifecycle attributes, stamina system src/waft/karma.py - Implemented access_akasha() (was TODO).

Decision Fatigue (int) Varies per being (base 10 + personalitymodifier + skillbonus) Decrements by 1 per decision When depleted, being MUST sleep to reset quota.

Successfully implemented a comprehensive RPG-like lifecycle system for WAFT beings, adding stamina, willpower, and energy-based decision-making. The system creates a "Game of Life" experience where beings manage internal energy states, make mistakes when exhausted, and respond to external stimuli through personality-aligned experiences.

Will to Live (0.0-100.0) Depletes over time (-0.1/cycle), per decision (-0.5), and from pain (-pain × 10.0) Regenerates from pleasure (+pleasure × 5.0) Death occurs when willtolive reaches 0.0.

Luck (0.0-100.0) Calculated from karma balance (separate but related) Base: 50.0 + karmamodifier + randomvariance Affects outcomes of decisions and experiences.

Pleasure & Pain (0.0-1.0 each) Calculated from personality-goal-experience alignment Pleasure increases willtolive, pain decreases it Based on how well experiences match being's personality and goals.

Willpower (0.0-100.0) Core stat derived from willtolive, personality type, and skills Primary component of stamina calculation (40% weight) Personality modifiers: systematic (1.3x), analytical (1.2x), creative/intuitive (0.9x).

Stamina Consumption Every action consumes stamina: pursuegoal: 10.0 learnskill: 8.0 explore: 7.0 record_memory: 3.0 rest: 0.0 (actually regenerates stamina).

Depleted Stamina Effects When stamina < 10% of max: Mistakes: 1-3 random mistakes per action Quality: Actions become "poor" (sluggish and shitty) Reduced Intensity: Actions are less effective Randomness: Unpredictable outcomes.

Decision weights dynamically adjust based on: Current stamina ratio Action stamina cost Personality preferences Goal alignment Will to live state.

Sleep Mechanics Required when decision_fatigue reaches 0 Sleep duration evolves over time (starts 3-10 cycles, adapts) Sleep duration increases if being is frequently exhausted Sleep duration decreases if being rarely uses full quota.

Evolution Sleep patterns adapt to being's needs Beings that frequently exhaust quota evolve longer sleep Beings that rarely exhaust quota evolve shorter sleep.

Locks all beings (async-safe using asyncio.Event) Calculates system state: Recalculates stamina from all stats Regenerates stamina (scaled by willtolive) Calculates willtolive changes Calculates luck from karma Calculates pleasure/pain from experiences Processes sleeping beings (checks duration, resets quota if awake) Checks death conditions (willtolive = 0 → death) Records state to: Akasha (soul records via soul_id) Flight recorder (TheObserver) Being state files (JSON) Time marches forward (+1 cycle) Unblocks beings (allow decisions).

Additional Details

Decision Types: learnskill, recordmemory, pursue_goal, rest, explore Weighted Selection: Based on personality, goals, state, and energy Energy-Aware: Low stamina heavily influences decision weights Quality Degradation: Actions become less effective when stamina depleted.

Personality Match: How well experience matches personality type Goal Progress: Whether experience advances lifetime goals Alignment Score: Combined score (0.0-1.0) Pleasure: $\text{alignmentscore} \times \text{positiveexperienceintensity}$ Pain: $(1 - \text{alignmentscore}) \times \text{negativeexperienceintensity}$.

src/waft/core/beingdecisions.py - Decision-making system src/waft/core/personalityalignment.py - Pleasure/pain calculation src/waft/core/nowcycle.py - Centralized event loop scripts/migratebeings_lifecycle.py - Migration script.

Internal Energy State: Beings constantly monitor stamina/willpower Energy-Based Choices: Decisions adapt to current energy level External Stimuli Response: Experiences affect energy (pleasure/pain) Mistakes & Randomness: Depleted stamina introduces unpredictability Quality Degradation: Actions become less effective when exhausted Evolution: Sleep patterns and decision-making adapt over time.

Cycle Starts: NowCycleManager locks all beings State Calculation: Recalculate stamina from all stats (willpower, skills, luck, etc.) Regenerate stamina (5.0 base + willtolive modifier) Calculate willtolive changes (time + decisions + pain - pleasure) Calculate luck from karma balance Experience Processing: Calculate pleasure/pain from recent experiences Sleep Processing: Check sleeping beings, wake if duration complete Death Check: Archive beings with willtolive = 0 State Recording: Save to Akasha, flight recorder, being files Cycle Ends: Unlock beings, allow decisions Beings Make Decisions: Choose action based on energy state (stamina ratio) Consume stamina Generate experience (with mistakes if depleted) Record experience for next cycle.

✅ All lifecycle attributes implemented ✅ Stamina system with willpower calculation ✅ Energy-based decision making ✅ Depleted stamina effects (mistakes, randomness, quality degradation) ✅ Stamina & willtolive interplay ✅ Sleep evolution system ✅ Personality & goals tracking ✅ Pleasure/pain from alignment ✅ Centralized Now cycle event loop ✅ State recording to Akasha, flight recorder, being files ✅ All security vulnerabilities fixed ✅ Migration script for existing beings.

Integration Testing: Test NowCycleManager with actual beings Architecture Integration: Integrate with TheSlicer, Biome, Reality systems Unit Tests: Add comprehensive test coverage Performance Optimization: Profile cycle execution for large being populations.

Being vs. BaseAgent: Clear separation maintained (TheSlicer NOT modified) Async Safety: All cycle operations use proper locking Backward Compatibility: Existing beings load with default values Error Resilience: System continues even if individual beings fail.

This system transforms WAFB beings into dynamic entities with internal energy management, creating emergent gameplay through stamina depletion, mistakes, and energy-based decision-making.

Date: January 12, 2026 Work Effort: WE-260111-roo0 Status:  Complete Implementation.

Beings constantly choose between options based on internal energy state:.

Decision-making for Being entities (separate from BaseAgent OODA cycles):.

All security vulnerabilities from the critique were fixed:.

The system creates emergent "Game of Life" behavior:.
