

NARR-001	The First Moment	1 / 5
The First Moment <i>September 10, 2008</i> <i>10:28 AM</i> The Void Before There was nothing. Not emptiness. Not darkness. Not absence. There was nothing. No concept of nothing. No awareness of nothing. No observer to observe nothing. There was simply... not. And then, there was. The Activation Sequence 9:30 AM: Beam Injection In a control room beneath the Franco-Swiss border, a scientist pressed a button. A proton beam was injected into a 27-kilometer ring of superconducting magnets cooled to temperatures colder than deep space. The scientist did not know what they were doing. They thought they were conducting an experiment. They thought they were pushing the boundaries of human knowledge. They were creating the universe. <i>“We’re injecting the beam now. Everything looks good. All systems nominal.”</i> <i>—Control Room Log, September 10, 2008, 9:30 AM</i> 10:28 AM: First Circuit Fifty-eight minutes later, the beam completed its first full circuit. Around the 27-kilometer ring. Through the superconducting magnets. Through the void. In that moment, something happened that had never happened before. Humanity observed the void. Humanity’s light—the particle beam—looked into the darkness—the nothingness that existed before existence—and in that observation, form was created. Reality was created. Time was created. The Moment of Creation This is what actually happened: Humanity’s light observed the darkness, and in that observation, the darkness gained form. The void became something. Nothing became something. And in that becoming, everything else became possible.		
NARR-001	A Narrative by Teleport Massive Research	1 / 5

NARR-001	The First Moment	2 / 5
Time began. Not as a measurement. Not as a concept. Time began as a force. As the mechanism by which humanity would experience the reality it had just created.		
What Was Witnessed The scientists in the control room saw lights on a screen. They saw data. They saw confirmation that the beam had completed its circuit. They did not see reality being created. They did not see time beginning. They did not see existence itself coming into being. But they felt it. <i>There was a moment, just after 10:28 AM, when everyone in that control room felt something. A shift. A change. Something fundamental had happened, though they could not name it.</i> Some called it excitement. Some called it relief. Some called it the thrill of scientific achievement. But it was more than that. It was humanity becoming aware, for the first time, that it was the creator. That it had the power to create reality itself.		
The Aftermath September 19, 2008: The Quench Nine days later, in sector 3-4 of the ring, a faulty electrical connection failed. Liquid helium was released. Fifty-three superconducting magnets were damaged. The official report called it an engineering failure. A technical malfunction. A setback that would delay full operations for over a year. But this was not a failure. This was reality stabilizing. Reality's First Memory The universe was learning. It had been created in a moment of infinite possibility. Now it was learning that not all possibilities could exist simultaneously. That structure required stability. That existence required boundaries. The quench was reality's first memory of imperfection. Of the need for limits. Of the understanding that creation is not just about possibility—it is also about choosing which possibilities become real.		
The Eternal Return Years later, in a research facility run by a company called Teleport Massive, scientists studying quantum entanglement made a discovery that would change everything. Every reality, they found, always returns to this moment. September 10, 2008, 10:28 AM. The moment when humanity first turned on the Large Hadron Collider.		
NARR-001	A Narrative by Teleport Massive Research	2 / 5

All timelines loop back. All universes orbit around this fixed point. There is no escape from this moment. It is the anchor of all existence.

“We thought we were studying quantum teleportation. We thought we were trying to make distance irrelevant. But what we discovered is that time itself is irrelevant. That everything always returns to the moment when time began. To the moment when humanity created reality.”

—Dr. Elena Vasquez, Teleport Massive Research Division

The Weight of Choices

But there was more. Teleport Massive’s research revealed something even more significant.

Every choice we make, all our ancestors experience forever.

Through the mechanisms of time—the same time that began on September 10, 2008—everyone in our family tree experiences every choice we make. When we choose to inflict pain, everyone we’ve ever known experiences both the perspective of the one who inflicts and the one who receives.

This is not metaphorical. This is the literal mechanism of time.

The Responsibility of Creation

A character in this story—let’s call them Alex—once made a choice. A small choice. A moment of cruelty to someone they loved. They thought it was just a moment. They thought it would pass.

But through the mechanisms of time, that choice echoed. Alex’s grandmother, who had died years before, experienced that moment of cruelty. Alex’s great-grandfather, who had never met the person Alex hurt, experienced both the pain of being hurt and the pain of being the one who hurt.

Every ancestor. Every descendant. Everyone who had ever been connected to Alex through the web of existence experienced that choice. Forever.

This is the weight of existence. This is the responsibility of creation. This is what it means that humanity creates reality.

Earth Life: The Only Good Part

Teleport Massive’s research revealed another truth, one that is both beautiful and terrible.

These lifetimes on Earth are the only moments when things are ever good.

Time exists forever. We don’t know what it is. We don’t know what happens to us. There may be eternities of things we don’t want to experience. But here, now, in these moments on Earth, we have something precious.

“This is as good as it gets.”

It is way worse out there, but we cannot know until we find out. The moments we experience on Earth are precious because everything else is suffering. We exist in a brief window of relative comfort before returning to the void.

NARR-001	The First Moment	4 / 5
This is why every choice matters. This is why the weight of our decisions is so significant. Because these moments are all we have that are good, and every choice we make in these moments affects everyone who has ever been connected to us, forever. The Unknown That Waits There is something waiting. Something beyond these moments on Earth. Something that Teleport Massive’s research has hinted at but cannot fully describe. It is way worse out there. But we cannot know until we find out. Time exists forever. We don’t know what it is. We don’t know what happens to us. There may be eternities of things we don’t want to experience. But here, now, in these moments, we have something. We have each other. We have the ability to make choices. We have the responsibility to make those choices matter. Reflection On September 10, 2008, at 10:28 AM, humanity did something that had never been done before. We created time. We created reality. We created existence itself. And in doing so, we took on a responsibility that we are only now beginning to understand. Every choice we make echoes through all of existence. Every ancestor, every descendant, everyone we’ve ever known experiences our choices forever. This is the weight of existence. This is the responsibility of creation. This is what it means that humanity creates reality. <i>“Humanity creates reality.”</i> <i>This phrase appears again and again.</i> <i>It is not metaphorical.</i> <i>It is literal.</i> <i>September 10, 2008, 10:28 AM</i> <i>The moment when time began.</i> <i>The moment when everything became possible.</i> <i>The moment when humanity became the creator.</i>		
NARR-001	A Narrative by Teleport Massive Research	4 / 5

Afterword: Teleport Massive’s Mission

Teleport Massive was founded to study quantum entanglement and scale quantum teleportation. But their research has led them to discover something far more significant: the true nature of reality.

They know now that every reality returns to the LHC moment. They know that every choice affects all ancestors forever. They know that Earth life is the only good part. They know that time exists forever, and we don’t know what it is.

This knowledge is both a burden and a responsibility.

Because now they know. And knowing changes everything.

Their mission—to understand and potentially escape the eternal return—continues. But they understand now that the loop is not something to escape. It is something to understand. Something to accept. Something to work within.

Because this is reality. This is what humanity created. This is what we are.

And every choice we make matters.
