

WAFT Evolution System Showcase

Summary: We decided to implement adaptive constraint enforcement for the two-page generator.

What Happened

We decided to implement adaptive constraint enforcement for the two-page generator. The choice was made to use real page counting instead of estimates. We will collect comprehensive metrics for every PDF generation. The final decision was to enable PNG conversion by default for quality verification.

We discovered that character-counting methods are unreliable for page estimation. The key insight is that real measurement beats estimation every time. We learned that adaptive algorithms can achieve exact page counts through iterative adjustment. It turns out that comprehensive metrics enable evolution with quality data.

We need to implement comprehensive testing for all PDF generation features. Next step is to create documentation for the metrics system. We must create example scripts demonstrating each feature. We should build a validation suite that checks all outputs.

Additional Details

The system represents a new approach to document generation with evolutionary algorithms. This is a framework for creating physical knowledge artifacts. The approach combines evolutionary algorithms with constraint satisfaction. The architecture uses genetic material for styling configuration.

How should we handle edge cases in page counting? What is the best approach for handling very long content? Why does the system sometimes need multiple iterations? How can we improve the fitness evaluation algorithm?
