

WAFT: The Evolutionary Code Laboratory

ABSTRACT

WAFT (Wide-Area Functional Taxonomy) is an evolutionary code laboratory.

1. Introduction

WAFT (Wide-Area Functional Taxonomy) is an evolutionary code laboratory. It allows AI agents to modify their own code and evolve through generations.

2. Architecture

THE SUBSTRATE

The system has three pillars: The Substrate: Code is DNA - agents can mutate their own source code The Physics: Scint Gym evaluates agents through error handling tests The Flight Recorder: Complete lineage tracking for scientific analysis.

THE PHYSICS

The system has three pillars: The Substrate: Code is DNA - agents can mutate their own source code The Physics: Scint Gym evaluates agents through error handling tests The Flight Recorder: Complete lineage tracking for scientific analysis.

THE FLIGHT RECORDER

The system has three pillars: The Substrate: Code is DNA - agents can mutate their own source code The Physics: Scint Gym evaluates agents through error handling tests The Flight Recorder: Complete lineage tracking for scientific analysis.

3. Conclusion

Agents evolve through generations, with successful mutations surviving and unsuccessful ones being discarded. The system produces phylogenetic trees showing the evolution of code over time.
