WAFT PDF GENERATION API DOCUMENTATION

FOR OFFICIAL USE ONLY

WAFT PDF Generation API Documentation ## Overview The WAFT PDF generation system provides a unified API for creating professional PDF documents from various content sources. --- ## Quick Start

```
from waft import PDF

# Generate from markdown
PDF.from_markdown(
    markdown="# My Document

Content here...",
    title="My Document"
).save("output.pdf")

# Generate from template
PDF.from_template(
    template="field_guide",
    title="My Guide",
    content="
```

INTRODUCTION

Content

```
"
).save("output.pdf")
```

```
---
```

```
## API Reference
```

```
### PDF.from_markdown()
```

Generate PDF directly from markdown content.

```
**Parameters:**
```

```
-
```

```
markdown
```

```
(str): Markdown content
```

```
-
```

```
title
```

```
(str, optional): Document title
```

```
-
```

```
style
```

```
(str, optional): Style preset (default: "premium")
```

```
-
```

```
output_path
```

```
(Path, optional): Output file path
```

```
**Returns:** PDF instance
```

```
**Example:**
```

```
PDF.from_markdown(  
    markdown="# Title  
  
Content",  
    title="My Doc"  
).save("output.pdf")
```

```
---
```

```
### PDF.from_template()
```

Generate PDF using a template.

****Parameters:****

-

template

(str or TemplateType): Template name

-

title

(str): Document title

-

content

(str): HTML content

-

series

(str, optional): Document series

-

number

(str, optional): Document number

-

printer_friendly

(bool, optional): Convert to printer-friendly

****Returns:**** PDF instance

****Example:****

```
PDF.from_template(  
    template="field_guide",  
    title="My Guide",  
    content="
```

INTRO

Content

```
",  
    series="MANUAL",  
    number="M-001"  
) .save("output.pdf")
```

```
---
```

```
### PDF.scientific_paper()
```

```
Generate a scientific research paper.
```

```
**Parameters:**
```

```
-
```

```
title
```

```
(str): Paper title
```

```
-
```

```
content
```

```
(str): Paper content
```

```
-
```

```
abstract
```

```
(str, optional): Abstract
```

```
-
```

```
authors
```

```
(list, optional): Author names
```

```
-
```

```
affiliations
```

```
(list, optional): Author affiliations
```

```
**Returns:** PDF instance
```

```
**Example:**
```

```
PDF.scientific_paper(  
  title="My Research",  
  abstract="This paper presents...",  
  content="
```

INTRODUCTION

```
...",  
  authors=["Dr. Smith", "Dr. Jones"]  
) .save("paper.pdf")
```

Available Templates

-

field_guide
: Field guide format

-

lab_notes
: Lab notebook format

-

tm_report
: Technical memo format

-

personal_memo
: Personal memo format

-

eldritch_journal
: Horror journal format

-

screenplay
: Screenplay format

-

heartfelt_letter
: Letter format

-

invoice
: Invoice format

-

storybook
: Storybook format

-

newspaper
: Newspaper format

-

code_docs
: Code documentation format

Style Presets

```
-
clinical_standard
: Academic, professional (Times New Roman)
-
premium
: Elegant, sophisticated (Premium serif)
-
professional
: Clean, readable (Georgia)
```

```
---
```

Best Practices

1. **Choose the right template** for your content type
2. **Use appropriate styles** for your audience
3. **Keep content focused** - templates work best with clear structure
4. **Test with printer_friendly=True** for physical printing
5. **Use series and numbers** for document organization

```
---
```

Troubleshooting

```
Problem: PDF generation fails
Solution: Check that WeasyPrint is installed:
pip install weasyprint
```

```
Problem: Template not found
Solution: Check template name spelling and availability
```

```
Problem: Content too long
Solution: Use TwoPageGenerator for constraint-based generation
```

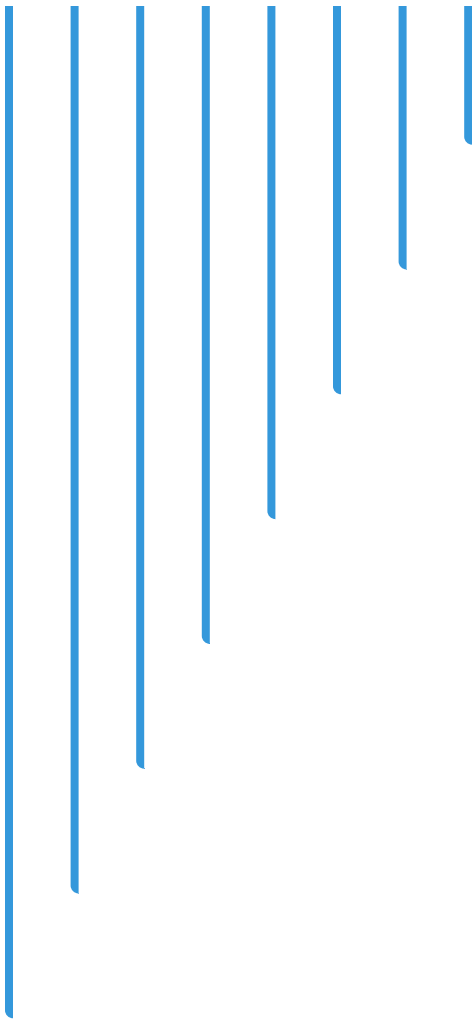

```
---
```

Support

For issues, questions, or contributions, see the WAFT documentation
